Proposal Type: Short
General Category: Pulsars
Observation Category: Galactic
Total Time Requested: 3 Hours
Minimum Useful Time: 1 hour

Proposal Title: Hunting for a Radio Pulsar in a New Long-Period Gamma-ray loud Binary

ABSTRACT:

2FGL J0846.0+2820 (hereafter J0846) is an unassociated Fermi source that became a non-detection in the recent (3FGL) Fermi data release, despite being detected at 5-sigma confidence in the earlier 2FGL catalog. Optical observations are consistent with a giant stellar source in a 8.1 d orbit around an unseen companion. Photometric measurements of the system show ellipsoidal modulations consistent with tidal distortion of the secondary by a massive central object. Formal fits to the photometry, in conjunction with our radial velocity measurements, lead us to the interpretation of a heavy neutron star primary and a partially stripped giant secondary. Here we propose 3 hrs of Arecibo observations to search for a radio pulsar in this system, which - if discovered - will provide critical new insights into the properties of this peculiar system.

Remote Observing Request

☐ Observer will travel to AO
☒ Remote Observing
☐ In Absentia (instructions to operator)

Instrument Setup

L-wide 327

Atmospheric Observation Instruments:

Special Equipment or setup: none

RFI Considerations
Frequency Ranges Planned

300 - 350
1150 - 1730

This proposal requires Iridium RFI protection at 1612 MHz between 10pm and 6am EST.
This proposal requires coordination with Punta Salinas radar within the band 1222-1381 MHz.
This proposal requires coordination with GPS L3 at 1381 MHz.
