Proposal Type: Regular
General Category: Astronomy
Sub-Category: Spectroscopy

Obervation Category:
Total Time Requested: 28 Hours

Proposal Title: An 8-10 GHz spectral line survey of G34.3+0.15

ABSTRACT:
Molecular line studies of the earliest phases of massive star formation in the sub/millimetric range have produce great advances in our knowledge of their physical and chemical conditions. However, molecular studies at low frequencies have been neglected although they can be use to characterize the chemistry at low temperature and density and could also provide a list of molecular tracers to prove the physical condition of massive protostars. We propose to perform the first molecular line search of the star-forming region G34.3+0.15 in the 8-10 GHz frequency range to obtain this information.
