Proposal Title: S-band high follow-up on soft X-ray transient 1H 1905+000

ABSTRACT:
Recently several new millisecond pulsars (MSPs) have been found that are able to switch their states from accretion-powered to rotation-powered and back. Similar behaviour is expected for the relatively dim, currently quiescent soft X-ray transient 1H 1905+000. Still, L-band Arecibo observations taken in 2006 and 2015 did not reveal any radio pulsations. This is possibly due to large pulse scattering, or to RFI contamination. Therefore, we propose to perform a 1.5 hour of higher frequency (S-High band) follow-up observations in order to avoid these issues and ultimately decide whether this transient belongs to the transitional MSP family.
