Proposal Title: The faint LSB galaxy population in the nearby Lynx-Cancer void

ABSTRACT:

Dwarf galaxies in voids, where galaxy properties should be well preserved, are the best for studies of the mass function and the total number density of low-mass galaxies, which can be compared with cosmological galaxy formation model predictions. The large voids studied are distant, however, and can only be probed down to galaxy luminosities of $L^*/50$. To go much deeper, we constructed a sample down to $L^*/8000$ ($M_B=-12$) of 80 galaxies with known redshifts in the nearby Lynx-Cancer void ($D=18$ Mpc), 4 of which we found through NRT HI and BTA H-alpha observations. As a pilot program for Arecibo, we selected a hundred faint ($B=18.5-19.5$) candidate Lynx-Cancer void LSB galaxies without known redshifts, which if they reside in this void, have $M_B=-12$ to $-14$ mag. These data will improve our knowledge of the properties of the faintest void galaxies.

Remote Observing Request

- Observer will travel to AO
- Remote Observing
- In Absentia (instructions to operator)

Instrument Setup

ALFA

Atmospheric Observation Instruments:
Special Equipment or setup:   none

RFI Considerations

Frequency Ranges Planned

1350-1430

This proposal requires coordination with Punta Salinas radar within the band 1222-1381 MHz.
