Observation Category: Planetary
Total Time Requested: 3 Hours
Minimum Useful Time: 2 hrs

Proposal Title: Radar Observations of Recently Discovered Near-Earth Objects 2019 TM

ABSTRACT:

We request one 3-hour observing track - including transmitter warm-up time - to observe the recently discovered near-Earth object 2019 TM on October 8th. This target will be within Arecibo’s declination from October 5th to 12th, with the closest approach distance to Earth of 0.024 au on Oct 8th. This is the first opportunity to observe this asteroid with the Arecibo radar. Each year about 40 to 60 newly discovered NEOs are observed using the planetary radar system at AO. Usually not much is known about recently discovered NEOs, except for their orbital parameters. Radar observations allow to refine its orbit, helping us not to lose the object. In addition, radar also allows us to estimate its size, rotation state, and surface properties.

Remote Observing Request

- [X] Observer will travel to AO
- [ ] Remote Observing
- [ ] In Absentia (instructions to operator)

Instrument Setup

- S-Band radar
- S-band receiver

Atmospheric Observation Instruments:

Special Equipment or setup: none

RFI Considerations
Frequency Ranges Planned
